

# Electric Vehicle Sales Analysis in India

The report was written by Prabhu Singh, a senior researcher with IHS Global Insight. It was published in the journal Automotive Research in 2013. Singh said that the report was based on a "high-level report" on electric vehicle sales. The report focuses on the industry's ongoing efforts to improve global competitiveness in the electric car market, including "flexibility, cost efficiency and reliability." In its report, IHS said it believes that the average electric vehicle sold in India is currently \$22,000 lower than in the United States, and that the number of people without access to electric vehicles is expected to rise by up to 30 percent this year. Singh said the report could help improve the competitiveness of the electric vehicle market in India. "India has a unique technology and a market that we don't see in other countries," said Singh, who has published extensively on electric vehicle sales in India. He said it would be "very beneficial for the electric vehicle market in India" to have a national report on the state-of-the-art electric vehicle market, for example, that could help guide the development of new technologies and services for the electric vehicle market.
